

## BASF Canada Quality Assurance Training Program (QATP)

### BASF QATP – SPF Training Programs

The BASF QATP - SPF Training Programs were developed to help ensure our WALLTITE® and ENERTITE® installers are properly trained, to comply with the BASF application guidelines and the CAN/ULC S705.2 application standard. Combining hands on classroom training backed up by dedicated field support teams across the country, a BASF installer receives some of the best training available in the spray foam industry.

To ensure that BASF Spray foam is installed in accordance with the National Building Code, BASF has teamed up with an independent third party, Caliber Quality Solutions Inc., to provide a CAN/ULC S718 compliant Site Quality Assurance Program. This program requires audits of contractors, ISO 17020 accredited site inspection programs, daily job site reports, and that all installers are certified to install foam in accordance with the CAN/ULC S705.2 application standard under an ISO 17024 accredited certification. This ensures the project owner that they are getting a quality installation of spray foam that's backed by a BASF warranty.
